

## Liverpool John Moores University

Title: HUMAN COMPUTER INTERACTION  
Status: Definitive  
Code: **7009COMP** (103268)  
Version Start Date: 01-08-2011

Owning School/Faculty: Computing and Mathematical Sciences  
Teaching School/Faculty: Computing and Mathematical Sciences

Team	Leader
David England	Y

**Academic Level:** FHEQ7  
**Credit Value:** 15.00  
**Total Delivered Hours:** 24.00  
**Total Learning Hours:** 150  
**Private Study:** 126

### Delivery Options

Course typically offered: Semester 2

Component	Contact Hours
Lecture	12.000
Practical	12.000

**Grading Basis:** 40 %

### Assessment Details

Category	Short Description	Description	Weighting (%)	Exam Duration
Report	AS1	Group Coursework - a student-led case study involving analysis, design, prototyping and evaluation of a sample interactive software application	100.0	

### Aims

*To develop an understanding of Human Computer Interaction as a multi-disciplinary subject, with a special focus on interactivity and usability in computer systems and software development.*

*To develop a user-centred approach to computer systems design.*

*To develop an in-depth understanding of usability and evaluation, and their impact on software development.*

*To introduce students to the latest research in HCI, and its application to new technologies.*

## **Learning Outcomes**

After completing the module the student should be able to:

- 1 Explain in depth the nature of HCI and the support from its constituent disciplines
- 2 Critically relate human physical and cognitive abilities to system design
- 3 Apply interactive development methods to a significant case study
- 4 Demonstrate a systematic and critical approach to the design, development and evaluation of interactive systems

## **Learning Outcomes of Assessments**

The assessment item list is assessed via the learning outcomes listed:

Case study                      1    2    3    4

## **Outline Syllabus**

*What is HCI?*  
*The Human Performance Model of HCI*  
*Usability Principles and Patterns*  
*Task Analysis*  
*Dialogue models*  
*Software Development Methods and tools for HCI*  
*Evaluation methods.*  
*Accessibility and Special Needs in Interaction*  
*Advances in Interaction Research*

## **Learning Activities**

Self-directed study and use of appropriate tool(s). Research into HCI and interrelated disciplines.

## Notes

Human Computer Interaction is the key to successful interactive systems development. It involves the bringing together of understandings of human abilities, and technical understanding of hardware and software technologies. This module aims to bring these different strands together to give the student a set of tools for the building of better interfaces. The group coursework is assessed by peer assessment.

Human-computer interaction (commonly referred to as HCI) researches the design and use of computer technology, focused on the interfaces between people (users) and computers. Researchers in the field of HCI both observe the ways in which humans interact with computers and design technologies that let humans interact with computers in novel ways. Human-computer interaction is a multidisciplinary study that focuses on the interaction between people and computers as well as the design of the computer interface. Factors to take into account include the user capabilities and cognitive processes, personality, experience, motivation, and emotions. Human computer interaction examples include: Interaction with a mobile app. Browsing a website from your desktop computer. Using internet of things (IoT) devices. Human-computer interaction or HCI is the study of interaction between people (users) and computers. It is often regarded as the intersection of computer science, behavioral sciences, design and several other fields of study. Interaction between users and computers occurs at the user interface (or simply "interface"), which includes both software and hardware, for example, general-purpose computer peripherals and large-scale mechanical systems, such as aircraft and power plants.
